

ABSTRACT

1
2
3 A striking device including a head having a striking
4 surface and a base mounted on an end of a handle for
5 reciprocation in a linear motion. A rail structure is
6 carried by the end of the handle. A rail receiving structure
7 is carried by the base and receives the rail structure for
8 reciprocating linear motion of the head between a forward
9 position and a rearward position. A biasing structure biases
10 the head into the forward position.
